

## Draft Carbon Calculator API Documentation

Allan D. Hollander

Version date: 24 October 2016

The urban tree carbon calculator has a RESTful API which is temporarily sited at a base URL of <http://169.237.167.66/carboncalc/api>. It is built using the Django REST framework and implements both GET and POST verbs for the included functions. The example GET queries below can be pasted into a browser. POST queries are made using JSON strings, and responses are in JSON. At present the following URLs are active:

- <http://169.237.167.66/carboncalc/api/biomass> (Biomass given species, region, DBH, and height)
- <http://169.237.167.66/carboncalc/api/bmasstoCO2> (CO2 equivalent given biomass)
- <http://169.237.167.66/carboncalc/api/invagecalc> (DBH or height given species, region, and age)
- <http://169.237.167.66/carboncalc/api/agecalc> (Age given species, region, DBH, and height)
- <http://169.237.167.66/carboncalc/api/growth> (Growth increment given species, region, DBH and height)
- <http://169.237.167.66/carboncalc/api/avoided> (Avoided emissions based on energy savings from a building shaded by the tree.)
- <http://169.237.167.66/carboncalc/api/futureage> (A list of future biomass and growth values given tree age and number of years to compute over.)
- <http://169.237.167.66/carboncalc/api/futuresize> (A list of future biomass and growth values given tree dbh, height, and number of years to compute over.)

The specifics of each function are listed below. Appendices 1 and 2 give the region and species codes respectively.
